Sharjah, UAE · UAE Resident

Software Engineer with five years of experience building production-grade products that perform and scale. Core expertise in React, Angular and TypeScript, with hands-on experience across backend systems, security and performance engineering. Introduced agentic AI workflows using Claude Code into production engineering teams, cutting delivery time and improving code review quality. Has experience setting engineering standards and mentoring junior engineers, and is looking to continue growing within a high-performing team.

TECHNICAL SKILLS

Frontend: React, TypeScript, Angular, Next.js, Redux Toolkit, React Query, Context API, Hooks, Storybook, MUI, Tailwind CSS, Styled Components

AI & Development Workflows: Claude Code, LangChain, OpenAI SDK, Agentic Workflows, Prompt Engineering

Architecture: Micro-frontends, Monorepo (Nx), Component-driven Design, Module Federation, SSR, Web Vitals, Lazy Loading, Code Splitting

Visualisation & Data: Chart.js, Recharts, D3, WebGL

Build & Tooling: Vite, Webpack, esbuild, ESLint, Prettier, CI/CD, Git, Docker

Testing: Jest, React Testing Library, Jasmine, Unit and Integration Testing

Backend & APIs: Node.js, NestJS, REST APIs, GraphQL, OAuth2, OIDC, JWT, WebSockets

Security: XSS, CSRF, CSP, WCAG 2.1, Secure Auth, SonarQube

EXPERIENCE

Senior Software Engineer | NymCard (Dubai, UAE)

Jul 2023 – Apr 2026

- Joined NymCard, a regulated payments infrastructure company whose platform powers card issuing, money movement, settlement and financial crime for clients including Fawry, Samsung, Riyadh Air and Neo. Worked in Angular and React as part of a five-engineer team, owned the core modules of the client-facing management platform including transaction management, roles, users and KYC flows, and independently built a field operations platform from scratch covering agent location tracking and sub-agent management across 20+ enterprise clients.
- Assigned to lead the full revamp of Neo, NymCard's oldest and most established client. Drove the project end to end over a year, managing development, client calls and coordination across ~50 stakeholders from mobile, QA, product and support teams through to user migration and UAT. Delivered successfully.
- Introduced AI-assisted development workflows using Claude Code, accelerating delivery cycles and improving PR review quality across the team. Defined frontend engineering standards, ran systematic code reviews and onboarded every engineer who joined the team.

Software Engineer | 10Pearls

Feb 2022 – Jun 2023

- 10Pearls is a global software engineering company. Worked across three enterprise client products. At Sophos, a global cybersecurity company, led the internationalisation architecture, built the component library from scratch and established the Storybook setup, all of which the client formally recognised as improvements to product quality. Maintained code standards through SonarQube and Jest, presented client demos and facilitated internal training sessions on unit testing.
- On LaunchGood, a global crowdfunding platform serving millions of donors worldwide, worked primarily on the backend using NestJS, contributing to the microservices architecture and handling access control logic using CASL.
- The third was Perspecta, a large-scale tax management portal serving over 50K users. Maintained and enhanced the Angular application, keeping it stable across browsers and compliant with accessibility requirements throughout complex multi-step workflows. Testing was handled with Jest throughout.

Software Engineer | SpurSol

Sep 2021 – Feb 2022

- SpurSol was building Knoccs, a B2B SaaS platform designed to bring all customer-facing teams under one roof, enabling businesses to manage conversations, route inquiries, track client context and resolve support issues without switching between tools. As the youngest developer on a team of eight, worked directly with the product lead and CEO to deliver the MVP within a six month timeline.
- Worked across Angular, .NET and SQL, contributed to the core product build, maintained high test coverage with Jest and resolved critical bugs that were blocking the release, ensuring the MVP was delivered on schedule.

Full Stack Engineer | TransformX

Oct 2020 – Sep 2021

- Joined TransformX to build their CPaaS aggregator from scratch, a platform connecting over 100 vendors and 150+ data points to help SMEs automate their service sales. Ran the initial tech stack analysis, led the product from Figma designs through to a live AWS deployment within a year using MongoDB, Express, React and Node.js.
- Built internal automation workflows that eliminated hours of manual work across the team. Hired, trained and managed two engineers and ran interviews as the team scaled.

EDUCATION

M.Sc. Computer Science · Institute of Business Administration (IBA) (CGPA: 3.6 / 4.0)

2022 – 2024

B.Eng. Software Engineering · NED University of Engineering & Technology (CGPA: 3.8 / 4.0)

2017 – 2021
